🏆 Problem: Attendance-Based Bonus to Pass

The Department of Computer Science recently released the final exam results for the course "Advanced Programming." The **pass mark** for the exam is **40**.

After checking the results, the faculty noticed that several students failed the exam by just a few marks. They want to give a **bonus to students based on class attendance** to reward regular participation.

The table `STUDENT_EXAM` stores the exam information:

```
STUDENT_EXAM (
    ID NUMBER,                  -- Student ID
    NUMBER_OF_ATTENDANCE NUMBER, -- Total classes attended
    EXAM_NUMBER NUMBER           -- Marks obtained in the final exam
)
```

🎯 Bonus Policy

The faculty decides to give bonus marks as follows:

Attendance Range	Bonus Marks
3 ≤ attendance ≤ 5	+2
6 ≤ attendance ≤ 10	+3
attendance > 10	+4
attendance < 3	0 (no bonus)

- **Only students who have failed (<40 marks) are eligible** for the bonus.
- Each student can receive **only one bonus** based on their attendance range.

📝 Task

Write a **PL/SQL program** that:

1. Uses an **explicit cursor** to read all students.
2. Updates `EXAM_NUMBER` according to the **attendance-based bonus** policy.
3. Counts the number of students updated.
4. Prints messages using `DBMS_OUTPUT.PUT_LINE`

📌 Sample Dummy Data

ID	Number_of_Attendance	Exam_Number
1	12	67
2	8	37
3	2	38
4	11	41
5	6	39
6	1	25
7	9	42
8	7	33

◆ Example Output After Running the Program

```
Already Passed. No update for ID: 1
Bonus +3 added for ID: 2
No bonus applicable for ID: 3
Already Passed. No update for ID: 4
Bonus +3 added for ID: 5
No bonus applicable for ID: 6
Already Passed. No update for ID: 7
Bonus +3 added for ID: 8
```
